

# Washing Fruits and Vegitables Sciencefaircenter.com Study Kit

Each water sample is tested for this Set of parameters:
Alkalinity, pH, Free Chlorine, Total Chlorine,
Total Dissolved Solids (TDS), plus
Bacterial Growth Indicator
(6 tests per Set)

#### TOTAL ALKALINITY

#### COLORIMETRIC TEST STRIPS

Total Alkalinity is a fundamental parameter in water testing. Alkalinity indicates the buffering capacity of natural waters. A water is said to be buffered if the pH is not changed greatly by addition of acides or bases. The most effective buffering action is within the pH range of water from near 6.0 to about 8.5.

Most natural waters are buffered by some extent by reactions which involve dissolved carbon dioxide CO<sub>2</sub>. It forms an indispensible reservior of carbon for photosynthesis. Thus, the productivities of water can be correlated with alkalinity and the buffering system.

The color chart for this test allows you to read total alkalinity in mg/L or ppm.

This test reports total alkalinity concentrations in water at 0, 40, 80, 120, 180 and 240 mg/L or ppm.

Results are obtained from this test 30 seconds.

# pH CHECK

#### Colorimetric test strips

This pH test is very versitile in that it can be used for drinking water testing, food processing, environmental applications or in any other water matrix.

pH is short for "power of Hydrogen." The balance of positively charged and negatively charged hydrogen ions in water determines pH.

Water that has a low pH is acidic or aggressive and can corrode plumbing resulting in metal ions being present in drinking water and damaged fixtures and pipes. Water that has a high pH is basic and will leave scale in pipes and on fixtures.

This test features two test pads both measuring pH at in the same range using different color indicators. This makes color matching easier than with other colorimetric tests.

This test reports water pH at the following levels: 2, 3, 4, 5, 6, 6.5, 7, 7.5, 8, 8.5, 9, 9.5, 10, 11, 12.

Results are obtained from this test in less than 1 minute.

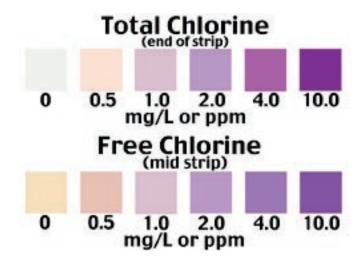

#### NOTE:

These pH test strips perform optimally in water with a Total Alkalinity above 80 mg/L or ppm. Water highly saturated with dissolved solids or highly buffered samples will give elevated results for pH.

#### NOTE:

National Secondary Drinking Water Regulations set forth by EPA recommend a pH level between 6.5-8.5

## TOTAL and FREE CHLORINE

Colorimetric test strips.

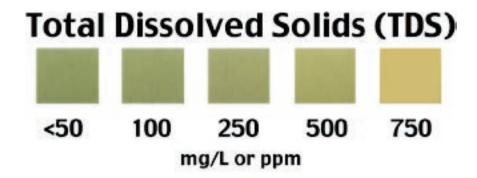

Total and Free Chlorine test strips are used for testing drinking water from a city water treatment system. This dual test is a convenient way of monitoring Total and Free Chlorine.

This test has been calibrated around EPA drinking water standards. Free Chlorine levels of 4.0 mg/L or greater exceeds Maximum Contaminant Level (MCL) as recommended by EPA.

The test reports mg/L or ppm of: Total Chlorine 0.0, 0.5, 1.0, 2.0, 4.0, 10.0 Free Chlorine 0.0, 0.5, 1.0, 2.0, 4.0, 10.0

Results are obtained from this test in 30 seconds.

# **Total Dissolved Solids**

#### Colorimetric test strips

Testing for Total Dissolved Solids (TDS) in tap water is very common and is very quick and easy with these test strips. The EPA Secondary Drinking Water Standard for for TDS is 500mg/L or ppm.

The color chart for this test allows you to read TDS in milligram/L or ppm.

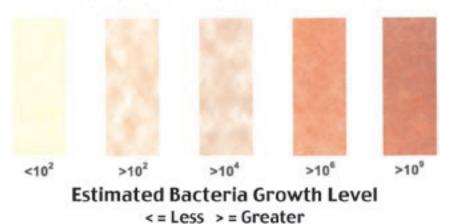

This test reports Total Dissolved Solids levels in water at: 0, 50, 100, 250, 500, 750 mg/L or ppm. (Note: concentration units are milligrams per Liter or parts per million).

Results are obtained from this test in about 30 seconds.

# Bacteria Growth Check

fastidious aerobic bacteria in water

## **BACTERIA GROWTH CHECK**

#### Colorimetric Test Strips

Bacteria Growth Check is a test strip that detects any fastidious (active) bacteria. This test could be used in a variety of applications, however it is not specific for any particular type of bacteria.

You can dip these strips in water or swab surfaces with them. The Bacteria test procedure then requires you to return the test strip into a clear plastic bag for incubation. After 24 to 48 hours of room temperature incubation, any fastidious bacteria on the test pad will multiply and turn the test pad pink to red. The darker and more consistent the test pad, the more bacteria that are present.

Bacteria Growth Check tests only a small water sample and requires a significant quantity of bacteria to show a change on the test pad.
